Clinical Interpretation of the Laboratory Tests

李柏蒼

高雄榮總腎臟科

An appreciation of the components of laboratory assessment of kidney disease is essential and helpful to the practicing clinician. The focus here is on certain features of the laboratory testing that might be of specific utility to diagnose renal disorders. In this talk, many important issues will be addressed including the evaluation of renal function, the interpretation of proteinuria, hematuria, the differential diagnosis of acute renal failure based on laboratory testing and the use of simple testing for the evaluation of electrolyte imbalance in clinical practice. At the end of each issue, cases will be presented to illustrate how this approach is used at the bedside. The listener may better appreciate the role of the laboratory in the diagnosis, follow-up and management of kidney disease.
